Reference A

This reference discloses a PLL circuit that receives one of a plurality of types of digital signals having different sampling frequencies and that then performs digital processing to the received digital signal. This PLL circuit is provided with a plurality of VCOs, each having a low conversion gain and a different center frequency, and a control means for switching sequentially from one of those VCOs to another while confirming that the frequency is not locked.

According to the present invention, to secure a stable VCO output over a wide range of frequencies, at the same time that VCOs are switched, the output level of the frequency multiplier circuit is controlled. Thus, the present invention differs from the invention disclosed in Reference A, in which VCOs are switched for the purpose of achieving stable synchronization over a wide range of frequency.
